RWorksheet_lastname#3b

Mike Anthony Taltal

2022-11-20

1. Create a data frame using the table below.

a. Write the codes

```
info <- data.frame(
  Respondents = c(1:20),
  Sex = c(2,2,1,2,2,2,2,2,2,2,1,2,2,2,2,2,2,2,1,2),
  Fathers_Occupation = c(1,3,3,3,1,2,3,1,1,1,3,2,1,3,3,1,3,1,2,1),
  Persons_at_Home = c(5,7,3,8,5,9,6,7,8,4,7,5,4,7,8,8,3,11,7,6),
  Siblings_at_School = c(6,4,4,1,2,1,5,3,1,2,3,2,5,5,2,1,2,5,3,2),
  Types_of_Houses = c(1,2,3,1,1,3,3,1,2,3,2,3,2,2,3,3,3,3,3,2)
)
info
```

```
##    Respondents Sex Fathers_Occupation Persons_at_Home Siblings_at_School
## 1            1   2                  1               5                  6
## 2            2   2                  3               7                  4
## 3            3   1                  3               3                  4
## 4            4   2                  3               8                  1
## 5            5   2                  1               5                  2
## 6            6   2                  2               9                  1
## 7            7   2                  3               6                  5
## 8            8   2                  1               7                  3
## 9            9   2                  1               8                  1
## 10          10   2                  1               4                  2
## 11          11   1                  3               7                  3
## 12          12   2                  2               5                  2
## 13          13   2                  1               4                  5
## 14          14   2                  3               7                  5
## 15          15   2                  3               8                  2
## 16          16   2                  1               8                  1

```

c.Is the mean number of siblings attending is 5?

```
Siblings_at_School = c(6,4,4,1,2,1,5,3,1,2,3,2,5,5,2,1,2,5,3,2)
mean(Siblings_at_School)
```

```
## [1] 2.95
```

d. Extract the 1st two rows and then all the columns using the subsetting functions.Write the codes and its output.

```
newinfo <- subset(info[1:2, 1:6, drop = FALSE])
newinfo
```

```
##   Respondents Sex Fathers_Occupation Persons_at_Home Siblings_at_School
## 1           1   2                  1               5                  6
## 2           2   2                  3               7                  4
##   Types_of_Houses
## 1               1
## 2               2
```

e. Extract 3rd and 5th row with 2nd and 4th column. Write the codes and its result.

```
thirdandfifth <- subset(info [3:5, 2:4, drop = FALSE])
thirdandfifth
```

```
##   Sex Fathers_Occupation Persons_at_Home
## 3   1                  3               3
## 4   2                  3               8
## 5   2                  1               5
```

f.Select the variable types of houses then store the vector that results as types_houses.Write the codes.

```
types_houses <-  info [c(6)]
types_houses
```

```
##    Types_of_Houses
## 1                1
## 2                2
## 3                3
## 4                1
## 5                1
## 6                3
## 7                3
## 8                1
## 9                2
## 10               3
## 11               2
## 12               3
## 13               2
## 14               2
## 15               3
## 16               3
## 17               3
## 18               3
## 19               3
## 20               2
```

g. Select only all Males respondent that their father occupation was farmer. the codes and its output.

```
males <- subset(info[c(3,11),c(2,3)])
males
```

```
##    Sex Fathers_Occupation
## 3    1                  3
## 11   1                  3
```

h. Select only all females respondent that have greater than or equal to 5 number of siblings attending school. Write the codes and its outputs.

```
zegzog <- subset(info[c(1:20), c(2,5)])
girls <- zegzog[info$Siblings_at_School >= 5,]
girls
```

```
##    Sex Siblings_at_School
## 1    2                 6
## 7    2                 5
## 13   2                 5
## 14   2                 5
## 18   2                 5
```

2. Write a R program to create an empty data frame. Using the following codes:

```
df = data.frame(Ints=integer(),
                Doubles=double(), Characters=character(),
                Logicals=logical(),
                Factors=factor(),
                stringsAsFactors=FALSE)
print("Structure of the empty dataframe: ")
```

```
## [1] "Structure of the empty dataframe: "
```

```
print(str(df))
```

```
## 'data.frame':    0 obs. of  5 variables:
##  $ Ints      : int
##  $ Doubles   : num
##  $ Characters: chr
##  $ Logicals  : logi
##  $ Factors   : Factor w/ 0 levels:
## NULL
```

a. Describe the results. #the result shows that the data frame consists of 5 variables and it is empty.

3. Interpret the graph.

#the graph shows the negative, positie, neutral sentiments of the #twitter users per day from july 14 to july 21 2020.
